

Ideation Phase

Brainstorm & Idea Prioritization Template

Brainstorming creates an open environment for generating multiple solution ideas before selecting the most practical concepts. The ideas below were developed for the Metro Ticket Booking problem and evaluated based on user value, feasibility, automation potential, and suitability for implementation on the ServiceNow platform.

Date	2 August 2026	Team ID	Not Specified
Project Name	Digitize Metro Ticket Booking Using ServiceNow	Maximum Marks	4 Marks

Step 1: Select the Problem Statement

Selected Problem: Metro passengers often experience delays and inconvenience when purchasing tickets through manual or counter-based processes. They need a faster digital solution that allows them to select stations, view the fare, complete booking, and receive a valid digital ticket with minimal effort.

Step 2: Brainstorm, Idea Listing and Grouping

Category	Idea	ServiceNow Capability
Booking	Create a Service Catalog item for metro ticket requests.	Service Catalog
Station Selection	Allow passengers to choose source and destination stations.	Catalog Variables
Fare	Calculate the fare automatically based on selected stations or travel rules.	Flow Designer / Business Logic
Ticket Generation	Generate a unique digital ticket and QR code after successful booking.	Flow Designer / Scripted Logic
Notifications	Send booking confirmation and ticket details automatically.	Notifications
Validation	Validate required travel information before processing the request.	Catalog Policies / Flow Designer
Tracking	Maintain booking records for reference and operational reporting.	Custom Table / Reporting
User Experience	Provide a simple digital booking process accessible from a portal.	Service Portal / Catalog

Step 3: Idea Prioritization

Ideas were prioritized using four criteria: user impact, implementation feasibility, automation value, and alignment with the ServiceNow platform. Higher scores indicate stronger candidates for the proposed solution.

Priority	Idea	User Impact	Feasibility	Automation	Decision
1	End-to-end digital ticket booking with QR generation	High	High	High	Selected
2	Automatic fare calculation	High	High	High	Selected
3	Automated booking confirmation and notifications	High	High	High	Selected
4	Service Catalog-based station and travel selection	High	High	High	Selected
5	Booking history and ticket tracking	Medium	High	Medium	Phase 1 / Extension
6	Advanced analytics for passenger trends	Medium	Medium	Medium	Future Enhancement

Prioritized Solution Concept

The selected concept is a ServiceNow-based digital metro ticket booking workflow. The passenger submits a booking request through a Service Catalog item, selects the source and destination stations, and provides required travel details. The automated flow processes the request, calculates the fare, creates the ticket record, generates a QR code, and sends the digital ticket and confirmation through notifications. This concept directly addresses the primary user pain points while making effective use of ServiceNow automation capabilities.

Recommended MVP Scope

- Service Catalog ticket booking form
- Source and destination station selection
- Automatic fare calculation
- Booking record creation
- QR-code digital ticket generation
- Automated confirmation notification
- Basic ticket status and reference information
